Department of Concrete and
Masonry Structures

Precast Concrete

Ing. Josef Fládr

Advantage

- ▶ Production accuracy
- ▶ Free shape solutions
- ▶ Quick mounting structure
- ▶ Without wet solution
- ▶ Better surface finish

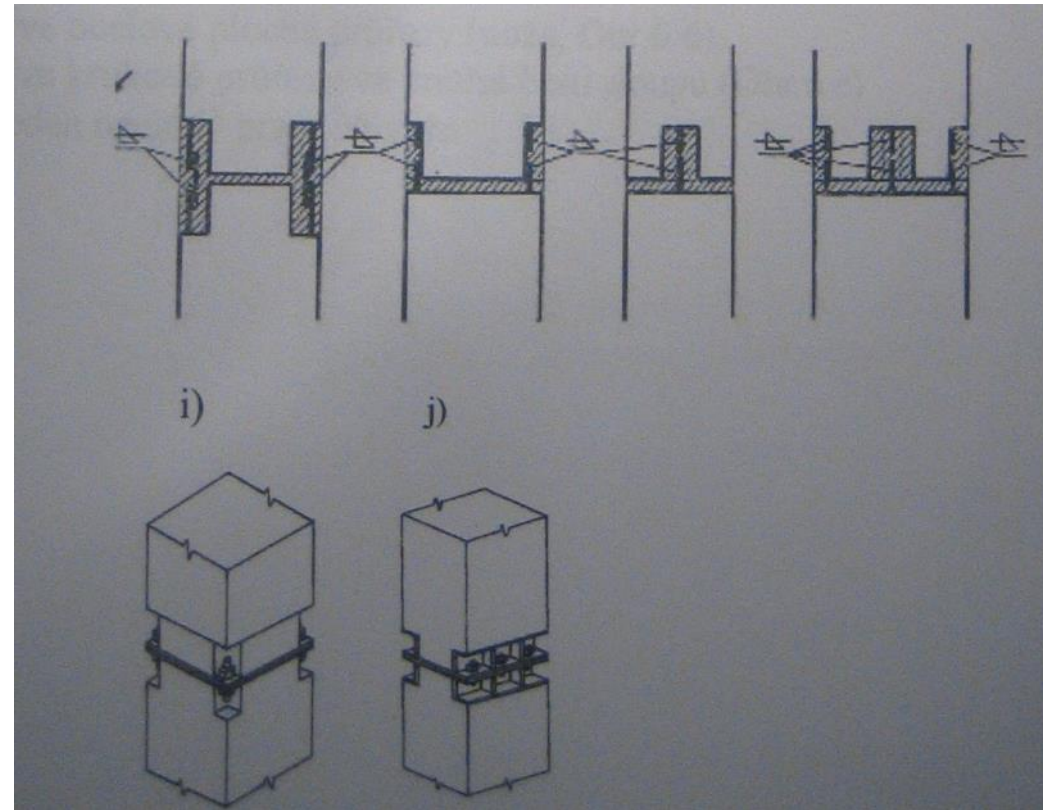

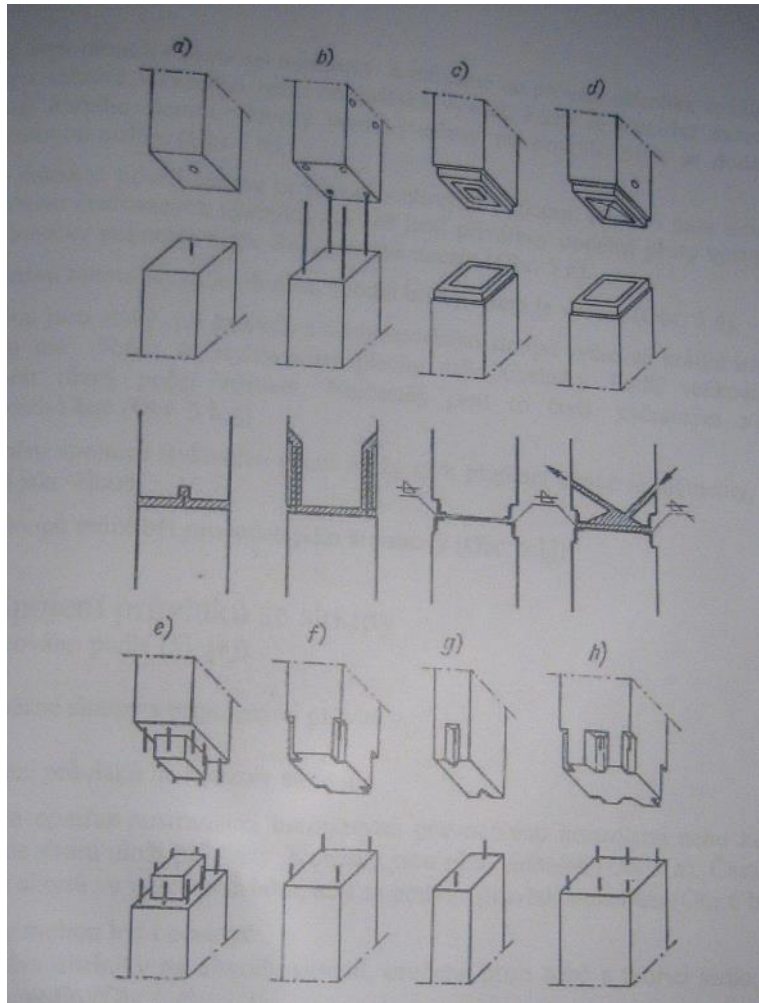

Disadvantage

- ▶ Heavy transport and handling
- ▶ Structure joint
- ▶ Precision construction foundation
- ▶ Extra reinforcement

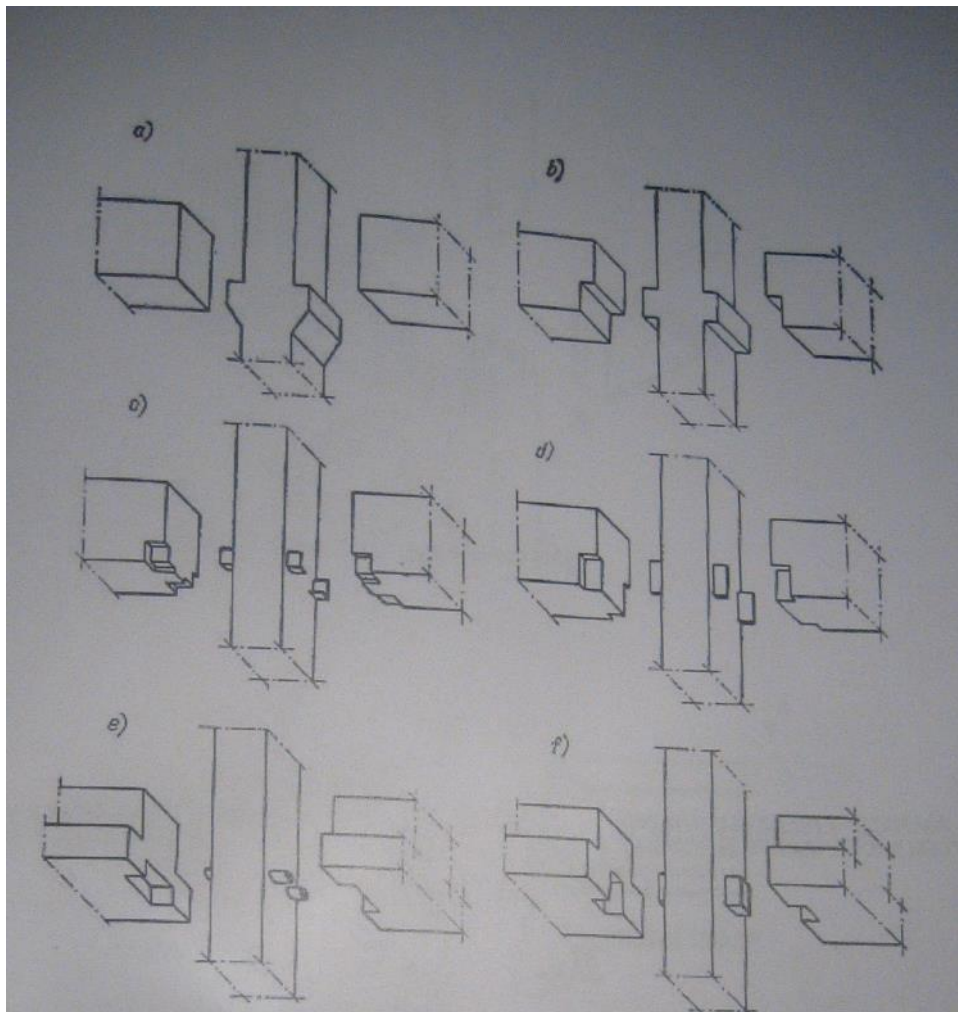

Structure joint

Lifting System

Počet nosných úchytů: $n = 3$

Počet nosných úchytů: $n = 2$

Počet nosných úchytů: $n = 4$

Lifting System

▶ Thread System

Lifting System

- ▶ Wire Loops System

Lifting System

- ▶ Spherical Lifting System

Design Lifting System

$$F_P = V \cdot \rho \quad \text{self-weight panel}$$

$$F_{adh} = A \cdot q \quad \Rightarrow \text{influence adhesion formwork,}$$

where:

- A interface between the element and the formwork
- q coefficient of friction

Coefficient of friction	
Smooth with oil	q = 1 kN/m ²
Smooth without oil	q = 2 kN/m ²
Rough	q = 3 kN/m ²

Design Lifting System

$$N_{d,1} = \delta \cdot \frac{\gamma_{go}}{n \cdot \cos \beta} \cdot (F + F_{tah})$$
$$N_{d,2} = \delta \cdot \frac{\gamma_{go}}{n \cdot \cos \beta} \cdot F_p$$

where:

- δ Dynamic coefficient,
- γ_{go} Safety coefficient 1,35,
- n number of active manipulation of elements,
- $\cos \beta$ Angle handling element,

Design Lifting System

Dynamic coefficient	
Stationary crane	1,0 - 1,2
Floating crane	1,3 - 1,4
Lifting and transport on flat terrain	1,5 - 1,65
Lifting and transport on uneven terrain	> 2,0

Theoretical basis of presented results were gained in support of the project FRVČ 915/2013 “Nástroje pro výuku navrhování betonových a zděných konstrukcí v anglickém jazyce”.
