# EVACUATION OF THE PEOPLE

SMART Move

---

- Total time of evacuation → 7 min 15 sec
- Last person leaving
  - 5<sup>th</sup> floor – 3 min 30 sec
  - 4<sup>th</sup> floor – 4 min
- First person leaving the building 45 sec
- Max people on the 2<sup>nd</sup> floor balcony at the time
  - 3 min 30 sec
- People stuck at the entrance – 5 min (270 people at the entrance floor)

- Total pass length of a single person
  - 160 m – the maximum length (middle pass)
  - Average speed (single person) – 1.2 m/s
  - Total: 190 sec (**3 min**)
- Door /entrance capacity
  - 2 m wide
  - At maximum 4 people passing at the time
  - $1000/4 = 250$  people
  - Assumed speed of the passing at average 0.5 m/s
  - $1 * 250 / 0.5 = 500$  (**6.5 min**)
- Stair passing flow
  - 3 m wide
  - Speed (at perfect case) 0.9 m/s
  - Capacity – around 4 people at the time per 1m
  - Around the corner – 2 person
  - Average speed (single person) – 1.2 m/s
  - Total: 190 sec (**3 min**)

## Hand calculation

---

- Re-design/ re-plan the building for safety evacuation
- Sprinkle system, fire detectors – alarm to people, roof openings to remove the smoke
- Not overload the capacity of the building (less than 1000 people)
- Problem/Weakest area
  - Entrance gate
  - Stair-flow
