

Connection design

by Component Based Finite Element Method

Lecture 1

Beam to Column Moment Connection

List of lectures

- 1) **Beam to column moment connection**
- 2) Hollow section joints
- 3) Joint of hollow to open section
- 4) Column base
- 5) Seismically qualified joints
- 6) Joints at elevated temperature

Aims and objectives

- Provide information on joint modelling of open section joints
- Introduce principles of CBFEM
- Provide an online training to students and engineers
- Illustrate the differences between numerical simulation and numerical calculation, e.g., between research-oriented FEM and design-oriented FEM
- Show the process of Validation & Verification
- Offer a list of references relevant to the topic

Lecture 1

Beam to column moment connection

**František Wald, Lukáš Gödrich, Marta Kuříková, Abhishek Ghimire,
Lubomír Šabatka, Jaromír Kabeláč, Drahoš Kojala**

Tutorial

- This lecture describes principles of **FEA modelling** of beam to column moment connection.
- Survey of both simple and FEM analyses and modelling are shown.
- Finally Validation, Verification and Benchmark case is presented.

Material was prepared under the R&D project MERLION II supported by Technology Agency of the Czech Republic, project No TH02020301.

Outline of the lecture

- **Introduction to design**
 - Design models
 - Global analyses
 - Classification
 - Component method
 - Interaction of internal forces
 - Assessment I
- **Component Based Finite Element Method**
 - General
 - Validation
 - Verification
 - Benchmark case
 - Assessment II
- **Summary**

Introduction to design

Lecture 1

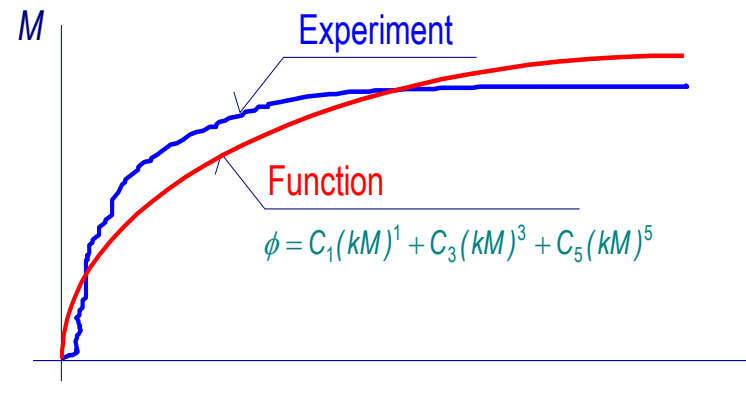

Beam to column moment connection

Past and Present design models

For joint design are available models:

- Experimental - history and contemporary design
- Curve fitting – currently hollow section joints design
- Analytical models
 - **Component Method (CM)**
- Research oriented finite element method
- Design oriented finite element method
 - **Component based FE Method (CBFEM)**

An example of component model for fire design (Block et al 2005)

An example of curve fitting model, Kishi and Chen (1990)

Summary

Joints characteristics in bending

- Major characteristics for joint in bending are
 - **Initial stiffness** $S_{j,ini}$
 - Small influence to distribution of internal forces
 - **Design resistance** $M_{j,Rd}$
 - Direct influence to resistance
 - **Deformation capacity** ϕ_{Cd}
 - Influence to plastic and seismic design only

Summary

Design model and experimental behaviour

- The design model reflects the need of designers to safe prediction of joint behaviour
- As structural elements are in joint designed for its material yielding f_y or its ultimate stress f_u
- The experimentally reached resistance is never the asked design resistance

Summary

Joints deformability/stiffness

- Joint deforms due to
 - **Shear force**
 - No influence to global distribution of internal forces
 - Is closed during erection
 - **Normal force**
 - No influence to global distribution of internal forces
 - Exception in space structures of course
 - **Bending moment**
 - Significant influence to distribution of internal forces
 - The highest is in rectangular closed frames

Summary

Physical and theoretical joint

- In global analyses with 1D members are forces transferred to beam ends.
- Forces are kept and moments are modified by action of forces on actual arms.
- Theoretical joint should be in equilibrium, see example right below.

Benchmark case

Assessment II

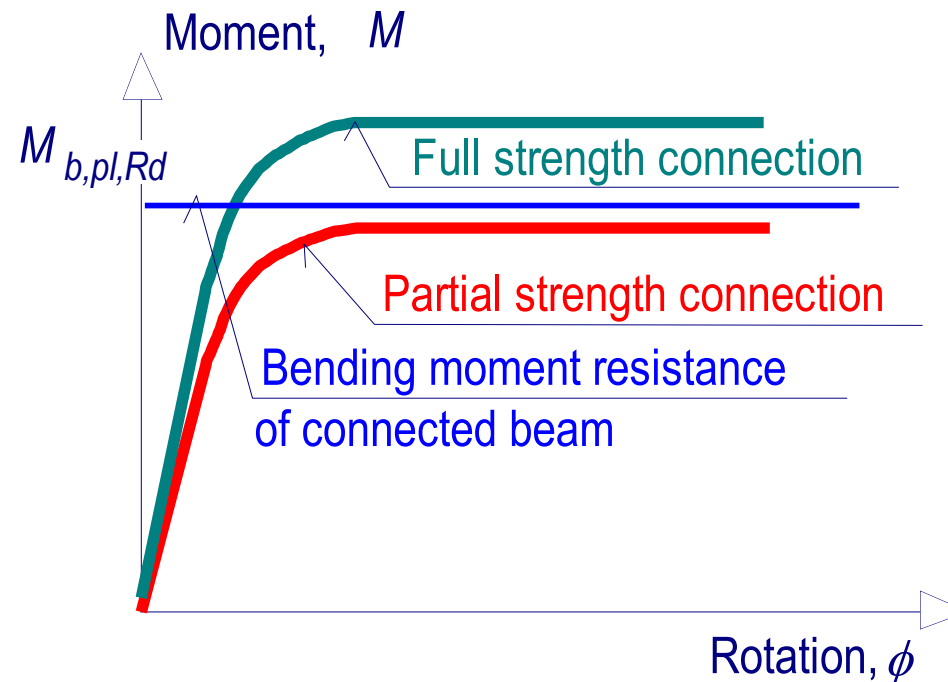

Summary

- For global analyses of steel frames are joints classified to simplify the modelling.
(Preferable as pinned and rigid joints.)
- According to Ch. 5 in EN1993-1-8:2006 are joints classified based on
 - Best engineering practice
 - Simplified assumption of frame behaviour
 - Actual influence of particular joint to frame design.
(This implicates recalculation.)

Classification based on resistance

- Bending moment resistance of connection to bending moment resistance of connected beam is compared in connections loaded in bending.
 - Full strength joints/connections $M_{j,Rd} > M_{b,pl,Rd}$
 - Partial strength joints/connections $M_{j,Rd} < M_{b,pl,Rd}$

Classification

Component meth.

Interaction

Assessment I

CBFEM

General

Validation

Verification

Benchmark case

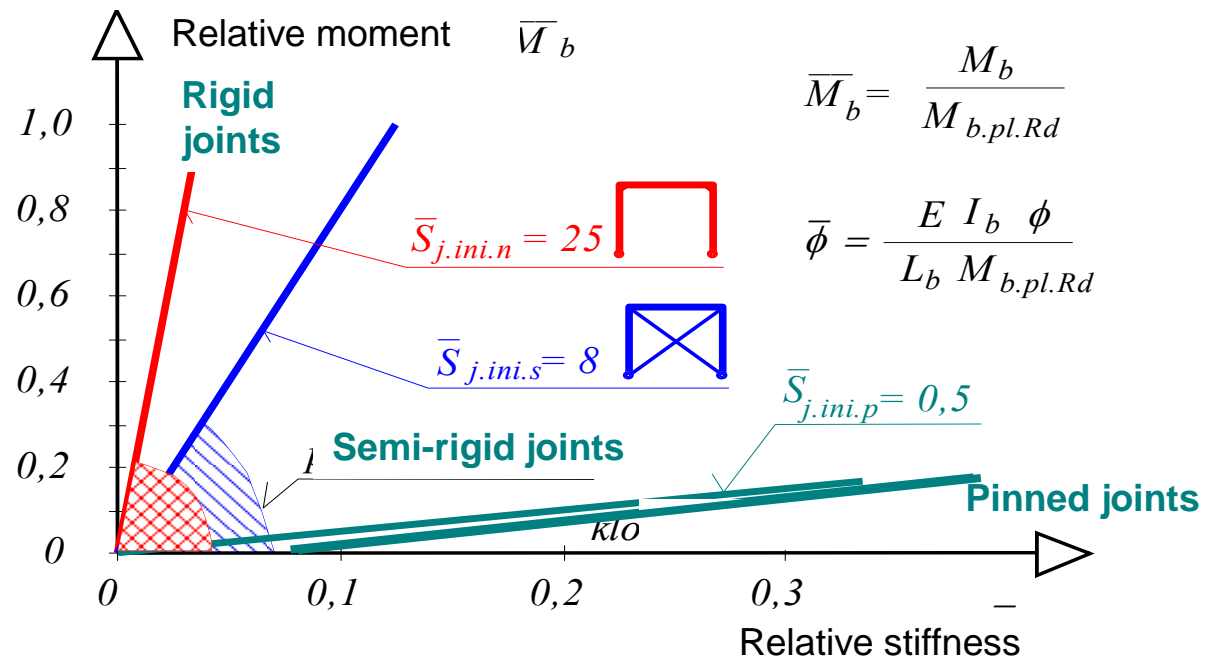

Assessment II

Summary

Classification based on stiffness

- Bending stiffness of connection to bending stiffness of connected beam is compared in connections loaded in bending.

- Rigid joint $S_{j,ini} \geq 25 E I_b / L_b$ (for frames without bracing)
- Semi-rigid joint $S_{j,ini,rigid} \leq S_{j,ini} \leq S_{j,ini,pinned}$
- Nominally pinned joint $S_{j,ini} \leq 0,5 E I_b / L_b$

Benchmark case

Assessment II

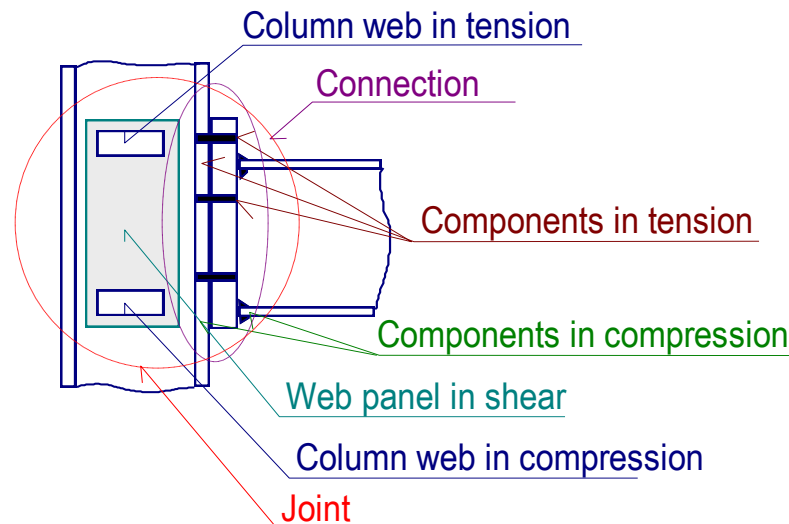

Summary

Component Method

- Component method is analytical procedure to evaluate joint resistance and stiffness.

It consist of steps:

- 1) **Decomposition of joint** to individual components based on assumed distribution of internal forces.
- 2) **Component description** in terms of deformational stiffness and resistance.
- 3) **Joint behaviour assembly** from the behaviour of its components based on assumed distribution of internal forces.

Assessment II

Summary

1) Decomposition of joint

- In simplified procedures joints design in one plane
- Joint is decomposed to component based on best engineering practice
- Example below is decomposition of the beam to column joint of open I/H sections with one end plate bolted connection is
 - To components in column (①②③④), end plate connection (⑤⑩), and connected beam (⑦)
 - Finally to rigid body and one spring

Summary

2) Component description

- The structural properties of basic joint components are described in Chapter 6 of EN 1993-1-8 for some basic components, eg. for

- Column web panel in shear
- Column web in transverse compression
- Column web in transverse tension
- Column flange in bending
- End-plate in bending
- Flange cleat in bending

- For composite joints are in EN1994-1-1:2005
- For another joints in literature

General

Validation

Verification

Benchmark case

Assessment II

Summary

3) Joint assembly

- Joint are assembled using the assumed lever arms of components z_x assumed according to best engineering practice
- E.g. for bolted connection with one bolt row may be guess simplified assembly
 - $F_{c,Rd}$ is compression force recon in the middle of bottom flange
 - $F_{t,Rd}$ is tensile force expected in the middle of bolt
 - z is estimated lever arm

$$M_{j,Rd} = \sum_i F_{ti,Rd} z_i$$

Assessment II

Summary

Interaction of bending moment and normal force

- Many joints are exposed to interaction of bending moment and normal forces,
- One example is simple portal frame, where the bolted eaves moment connection transmits the normal force based on the rafter inclination.
 - The Normal force may be neglectable but for greater inclination is for connection significant.

Interaction Assessment I

CBFEM

General
Validation
Verification
Benchmark case
Assessment II

Summary

Simplified prediction of interaction of bending moment and normal force

- In EN 1993-1-8:2005 is recommended:
 - Design moment resistance of joint $M_{j,Rd}$ does not take account of any axial force N_{Ed} in the connected member. Axial force in the connected member N_{Ed} should not exceed 5% of design plastic resistance of connected element $N_{pl,Rd}$.
 - Otherwise should be considered by:
 - Linear interaction
 - Component method
- Interaction ratio is calculated to the vectors between points of the interaction curve.

$$\longrightarrow \frac{N_{Ed}}{N_{j,Rd}} + \frac{M_{Ed}}{M_{j,Rd}} \leq 1$$

Summary

- Bilinear ideal elastic plastic diagram is used in design oriented models as CBFEM according to Ch. 7 in EN 1993-1-5:2006 and the slope of plastic branch is due to numerical stability $E/1000$.
- Plastic strain in plates is limited by 5%.
- In research oriented models is calculated the true stress-strain diagram from the material properties obtained in tensile tests, which is taking into account the necking of the coupon during its yielding before rupture.

Plate

- Four node quadrangle shell elements are applied with six degrees of freedom, i.e. three translations and three rotations, in every node.
- End plates, element profiles, slender stiffener, T-stubs are modelled as plates connected in joint by constrains and the connection check is independent on the element size.
- Example of T-stub shows the influence of mesh size on the T-stub resistance.
 - Dashed lines are representing 5%, 10% and 15% difference.

Summary

Working diagram of spring model for Component bolt in tension

- For bolt's resistance is expected maximum allowed plastic strain ϵ_{mpb} as 25 % of elongation to fracture of bolt according to EN ISO 898-1:2013, the values are summarised in Table below.
- The stiffness in tension is calculated as $k = E A_s / L_b$, where A_s is tensile area of bolt and L_b is the distance between the centers of the head and the bolt nut.

Maximum allowed plastic strains for bolts $\epsilon_{t,Rd}$

Bolt grade	4.8	5.6	5.8	6.8	8.8	10.9
ϵ_{mpb} %	3,5	5,0	2,5	2,0	3,0	2,3

Summary

Working diagram of spring model for Component bolt in shear

- Bolt in shear is simulated by bilinear diagram with its initial linear part and nonlinear one, which may be simplified as second linear one.
- Values are obtained by experiments and summarised in design standards.
- The values in Ch. 6 EN1993-1-8:2006 represents well the bearing of plate and bolt and shearing of the bolts shaft.

Summary

Welds

- Filled weld is modelled by equivalent solid elastoplastic element, which is added between plates to express the weld behaviour, see Fig. below.
- The element respects the weld throat thickness, position, and orientation to assure good representation of weld deformation stiffness, resistance and deformation capacity.
- The plastic strain in weld is limited to 5%.

Assessment II

Summary

Verification of generally loaded end plate

- Resistance calculated by CBFEM is compared with the results of CM and experimental results. The sensitivity study is focused on ratio of bending moments in strong and weak axis, see Figure below.
- CM with linear interaction gives conservative values of resistance.
- CM with quadratic interaction gives the highest resistances, which are to experimental results still rather conservative.
- CBFEM gives similar results as CM with quadratic interaction.

Summary

Verification of end plate

- A comparison of the global behavior described by the moment-rotation diagram is prepared. Attention is focused on initial stiffness, resistance and deformation capacity.
- Sample 0° with strong axis bending moment is selected to present as reference, see Figure below.
- CM gives higher initial stiffness compared to CBFEM and experimental data.
- Resistance predicted by CM and CBFEM is similar.
- The resistance obtained experimentally is higher.

Summary

○ Inputs

○ T-stub

- Steel S235
- Flange thickness $t_f = 20$ mm
- Web thickness $t_w = 20$ mm
- Flange width $b_f = 300$ mm
- Length $b = 100$ mm
- Double fillet weld $a_w = 10$ mm

○ Bolts

- 2 x M24 8.8
- Distance of the bolts $w = 165$ mm

○ Outputs

- Design resistance in tension $F_{T,Rd} = 175$ kN
- Collapse mode - full yielding of the flange with maximal strain 5 %
- Utilization of the bolts 88,4 %
- Utilization of the welds 49,1 %

▶ Summary

- The design of beam to column moment connections is focussed to preferable yielding of steel plates and brittle failure of fasteners, bolts, welds.
- The design of beam to column moment connection by Component Method (CM) is very accurate in components behaviour modelling.
- The lever arm is in CM estimated based on the best engineering practice. Its prediction is good in well know and tested connections and joints. Its educated guess affects the resistance.
- The CM is prepared for software tools and design tables not for had calculation.

Validation
Verification
Benchmark case
Assessment II

Summary

- The design of connections by finite element method is not replication of the physical experiment. The designer is interested into the limited yielding of steel plates and failure of fasteners.
- Component based finite element method (CBFEM) is taking advantage of accurate modelling of component behaviour based on experiment and accuracy of discrete analyse of steel plate by FEM
- The Validation and Verification procedure is integral part of any finite element analyses. The procedure is checking the software and the use by designer.
- CBFEM offers the designer a discrete view on the behaviour, see next slides.
-

Summary

Further plastification

Global and local behaviour

$M = 290 \text{ kNm}$

$F_i = 78,6 \text{ mrad}$

$S_i = 3,7 \text{ MNm/rad}$

Moment, kNm

Rotation, mrad

Resistance reached

- By 5% strain in column web loaded in shear and compression.
- **Well designed steel connection** starts to plasticize early to allow plastic distribution of forces between connectors/plates.

Summary

The major joint in bending design characteristics

where $S_{j,ini}$ is the initial stiffness,

$M_{j,Rd}$ is the design bending resistance,

φ_{Cd} is the deformation capacity

are well described.

What is the major reason

of using CBFEM for Beam to column moment connections?

- **Generally loaded complex joints** is difficult to design in space accurately by Component or other methods.
- The example of design procedure by CBFEM is shown below.

Notes to users of the lecture

- Subject Design of the open sections joints.
- Lecture duration 60 mins.
- Keywords Civil Engineering, Structural design, Steel structure, Beam to column connection, Beam to beam connection, Beam splices, Open section, Joint, Component Method, Component based Finite Element Method, Eurocode.
- Aspects to be discussed Experiments, Reasons and methods of classification, Principles of CM, Major components in CM, Interaction of forces, Components in CBFEM, Principles of CBFEM, Validation and Verification.
- Further reading relevant documents in references and relevant European design standards, Eurocodes including National Annexes.
- Preparation for tutorial exercise see examples in References.
