

*CM01 – Concrete and Masonry Structures 1*

# Introductory information to seminars

# Course overview

Concrete and Masonry Structures 1 is **an advanced course**. You **must have prior general knowledge of design of concrete structures** – e.g., from the “Fundamentals of Structural Design” course.

# Seminar overview

## Seminars:

- homework assignment,
- brief explanation of the homework,
- homework consultations and submission.

You must attend the lectures of this course, because **important information needed for the completion of the homeworks will be explained in the lectures.**

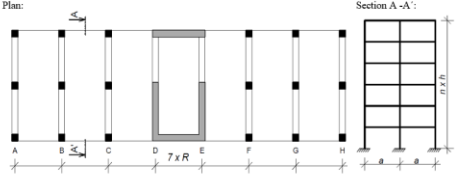

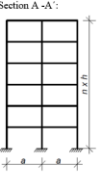

# Homework assignments

There will be **6 mandatory task assignments** (divided into **12 homeworks**) in this seminar. All of the task assignments are available on [my webpage](#).

Individual homeworks will be assigned on each seminar.

Concrete and Masonry Structures 1 (133CM01)

### Task 1: Frame structure

**Scheme of the structure:**  
Plan:   
Section A-A: 

**Individual parameters** (parameters in **bold** you can find on [teacher's website](#)):  
**Geometry:**  $R, a$  [m] – horizontal dimensions,  $h$  [m] – floor height,  $n$  – number of floors  
**Materials:** Concrete – concrete class  
Steel B 500 B ( $f_k = 500$  MPa)  
**Loads:** Other permanent load of typical floor ( $g_{floor}$ ) [kN/m<sup>2</sup>]  
Other permanent load of the roof ( $g_{roof}$ ) [kN/m<sup>2</sup>]  
Live load of typical floor  $q_{floor}$  [kN/m<sup>2</sup>]  
Live load of the roof  $q_{roof}$  [kN/m<sup>2</sup>]  
Self-weight of the slab according to calculated depth

**Another parameters:**  $S$  – Exposure class related to environmental conditions  
 $Z$  – Working life of the structure

**Please work out:**

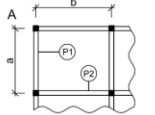

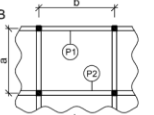

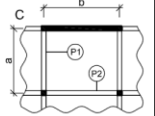

1. Preliminary design of the dimensions of the structure (slab depth, dimensions of the beam, dimensions of the column).
2. Sketch of the structure.
3. Structural analysis:
  - Check of dimensions of the beam from preliminary design.
  - Calculation of bending moments, shear forces and normal forces in the frame using suitable software.
  - Design of reinforcement of the bottom frame.
4. Reinforcement drawing of the bottom frame.

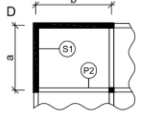

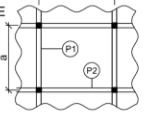

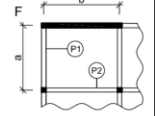

Concrete and Masonry Structures 1 (133CM01)

### Task 2: Two-way slab supported on four sides

Consider a reinforced concrete structure of **multifloor** building composed of walls, columns and continuous slabs. All spans of the slab are supported by walls or rigid beams on four sides. There are no openings in the slab.

**Schemes of the structures:**

A  B  C 

D  E  F 

**Individual parameters** (parameters in **bold** you can find on [teacher's website](#)):  
**Scheme:** given scheme, given beam (P) or wall (S)  
**Geometry:**  $a, b$  [m] – horizontal dimensions of the structure ( $a$  see 1st task),  $h_s$  [mm] – depth of the slab  
**Materials:** see 1st task  
**Loads:** see 1st task, values for typical floor (except the **self weight**, which will be different)

**Please work out:**

1. Calculation of bending moments in the slab:
  - a) Using linear analysis (do not consider the effect of torsion moments caused by prevented lifting of the corners of the slab). Proceed from the assumption that the deflections in  $x$  and  $y$  directions are equal.
  - b) Using precalculated tables based on the theory of plasticity (effect of torsion moment is included).
2. Check of given depth of the slab – consider bending moments from 1b) (if the slab is not checked, just propose the adjustment, **do not** recalculate bending moments!)
3. Calculation of loading of given beam or wall.

		Task 1										Task 2				Task 3		Task 4	
No.	Name	R [m]	a [m]	h [m]	n	(g-g <sub>0</sub> )/floor,k [kN/m <sup>2</sup> ]	(g-g <sub>0</sub> )/roof,k [kN/m <sup>2</sup> ]	q <sub>floor,k</sub> [kN/m <sup>2</sup> ]	P	Z [years]	Concrete class	Scheme	Member	b [m] [m]	h <sub>s</sub> [mm] [m]	d [m]	T	W

# Homework support materials

For the assigned homework, support materials (presentations, tables, examples of solved HWs etc.) are available on [my webpage](#).

SUPPORTING DOCUMENTS FOR HOMEWORKS

---

**Introductory information**  
[seminar presentation](#).

**Task 1 – Reinforced concrete frame**  
Homework 1 – Preliminary design of frame structure  
[seminar presentation](#),  
[concrete cover \( \$c\_{min,dur}\$ \)](#),  [\$\mu\$ / \$\zeta\$ / \$\xi\$  coefficients](#), [concrete properties](#), [greek letters](#),  
[example of HW1 \(Vera\)](#), [example of HW1 \(Engin\)](#).

Homework 2 – Calculation of internal forces in 2D frame  
[seminar presentation](#),  
[modelling in IdeaFrame \(video\)](#),  
[example of HW2 \(Vera\)](#), [example of HW2a \(Engin\)](#), [example of HW2b \(Engin\)](#).

Homework 3 – Reinforcement of the beam  
[seminar presentation](#),  
[example of HW3 \(Vera\)](#), [example of HW3 \(Engin\)](#).

Homework 4 – Reinforcement of the column  
[seminar presentation](#),  
[example calculation of interaction diagram](#), [nomogram](#), [interaction diagram software](#).

# Homework support materials

In order to best understand the topics, **complete the homework on your own using the information from lectures and seminars.**

If necessary, **you can inspire yourself in the “example homework”** on my website. However, keep in mind that there might be mistakes or missing parts in the homeworks, so **do not use them as your primary resource!**

Homework 1 – Preliminary design of frame structure

[seminar presentation,](#)

[concrete cover \( \$c\_{min,dur}\$ \),  \$\mu/\zeta/\chi\$  coefficients, concrete properties, greek letters,](#)

[example of HW1 \(Vera\), example of HW1 \(Engin\).](#)

# Seminar requirements

In order to **successfully pass the seminar**, you must complete and submit **all homeworks**, in their respective deadlines – see the [Seminar programme](#). Each homework must be **personally consulted** with me, and you must obtain a confirmation of the **successful completion** of the homework from me – see the [Completion table](#).

Recommended submission date for each homework is 1 week after its assignment. **Deadline for each homework is 2 weeks after the assignment\***.

**If you fail to meet the deadline 2 times, you will fail the seminar, and you will not be able to take the exam and complete the course!**

\* Under special circumstances (e.g., illness), the deadline can be extended – but only if you request the extension BEFORE the deadline!

# Seminar points

During the semester, **you can obtain “seminar points”** which will be used when determining **your final mark in this course**. **The seminar points make 30 % of the final mark!**

You can obtain the points for:

- 1 point for **timely completion** (1 week) of each homework (up to **12 points total**),
- 1 point for **exceptional quality**\* of each homework (up to **12 points total**),
- up to **6 points** for **activity**† during the semester.

\* Clear and understandable calculations with adequate titles, notes, and pictures.

† Communication during the seminars and good understanding of the topics.

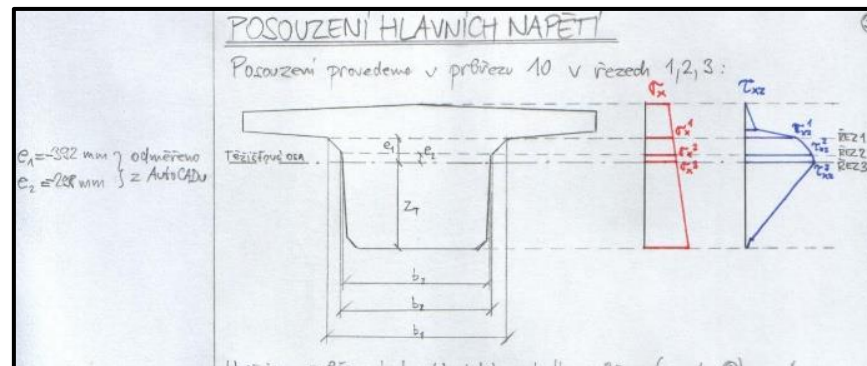

# Homework rules

There are **specific rules** regarding the form of the homeworks.

- Write your homework on **one-sided A4 paper with 5 cm left margin**.
- All **load** calculations must be done in tables.
- Draw **simple but clear schemes** (for better understanding).

SLAB LOAD				
Type	Name	$f_k$ [kN/m <sup>2</sup> ]	$\gamma_F$	$f_d$ [kN/m <sup>2</sup> ]
Permanent (Dead load)	-Surface layer (carpet/ceramic)	0.20	1.35	0.27
	-Glue layer	0.01	1.35	0.01
	-Concrete (leveling layer)	1.25	1.35	1.69
	-Separation foil	0.01	1.35	0.01
	-Acoustic insulation (EPS/XPS)	0.05	1.35	0.07
	-Reinforced concrete	0.28*25=6.88	1.35	9.28
	-Plaster	0.06	1.35	0.08
	-Partitions	0.11	1.35	0.15
Variable (Live load)		2.00	1.50	3.00
Total		$\Sigma = 10.57$		$\Sigma = 14.56$

5 cm	$M_{Ed} = 1/8 * f * L^2$			
	$M_{Ed} = 1/8 * 8 * 5^2$			
	$M_{Ed} = 25 \text{ kNm}$			
	Load	Char.	$\gamma_F$	Design
	...	...	1,35	...
	...	...	1,50	...
	TOTAL			

# Homework rules 2

There are **specific rules** regarding the form of the homeworks.

- Homework must be **well arranged, clear, and controllable**.
- Pages must be **numbered** (for cross referencing).
- All **calculations and assumptions** used in the analysis **must be written**.
- Write **general equations** (with letters), **specific equations** (with numbers), and **results with units**.

Submitted homework which will not in accordance with these rules will be returned to you for revision.

# Introductory test

# Assignment 1

Calculate the **design area load**  $f_{a,d}[\text{kN/m}^2]$  on a concrete slab (plate). The slab is 200 mm thick and is loaded by:

- slab self-weight,
- other dead (permanent) load:  $f_{(g-g_0),k} = 1.5 \text{ kN/m}^2$ ,
- live (imposed) load:  $f_{q,k} = 3 \text{ kN/m}^2$ .

Hint:

$$g_0 = h \gamma_c$$

$$\gamma_G = 1.35$$

$$\gamma_Q = 1.5$$

# Assignment 2

Calculate the **load-bearing capacity of a cross-section in bending**  $M_{Rd}$  of the given cross-section. Overall area of steel rebars is  $A_s = 800 \text{ mm}^2$ . Materials:

- concrete C30/37,
- steel B 500B.

Hint:

Calculation steps:

- 1)  $f_{cd} = \dots$  and  $f_{yd} = \dots$
- 2)  $x =$
- 3)  $z =$
- 4)  $M_{Rd} =$

thank you for your attention
